

Revelation Universal Driver Version 5.0

Overview

This README file describes the licensing agreement for using the Revelation Universal Driver 5.0 and any information not included in the printed documentation.

Licensing

The license agreement for the Revelation Universal Driver 5.0 permits you to install this software on one file server in your network. If you want to install this product on multiple file servers, you must purchase a license for each server.

The Universal Driver 5.0 will **ONLY** communicate with OpenInsight 9.4 and above. All other versions of OpenInsight and Arev will return a FS1018 error message. The Universal Driver 4.7 can be utilized with OpenInsight 9.4 and below as well as Arev.

Installation

Please refer to [The Revelation Universal Driver Installation Guide](#) included with the product for complete information on installing the Universal Driver.

Upgrades

The Universal Driver 5.0 is NOT an upgrade to the Universal Driver 4.7. The Universal Driver 5.0 is for use with OpenInsight 9.4 and above. The Universal Driver 5.0 can co-exist on the same server as the Universal Driver 4.7.

What has changed from the Universal Driver 4.7:

Latest Communication Technology - The Universal Driver 5.0 utilizes the latest communication libraries to provide robust, reliable service between the UD server and its clients.

64-bit – The Universal Driver 5.0 may only be installed on 64-bit versions of Windows Operating Systems (e.g. Server 2008 or Server 2012).

Secure communications option - If desired, the communications channel between the UD server and its clients can be SSL encrypted, preventing unauthorized interception of sensitive information.

Authenticated clients option - If desired, only explicitly authorized client software can connect to the UD server over a secure SSL channel.

Connection Retry - If the communication link between the client and server is temporarily lost, and then restored, the client will attempt to reconnect and resume normal operations.

VSS friendly - The UD 5.0 is VSS (**Volume Snapshot Service**) aware and can thus be backed up with minimal disruption to normal operations.

Linux (planned) or Windows Implementation - The UD 5.0 can be installed on either Windows or Linux servers.

The Universal Driver 5.0 also has an interface to the OI Console that allows you to view and manage record locks without having to stop the Linear Hash Service. The OI Console interface allows multiple locked records to be selected and unlocked in one step from any workstation on the network.

Note: The OI Console is not available for use with OpenInsight 9.4. You may utilize the UD 4.7 Manager to manage record locks.

What configurations does the Universal Driver work with?

<u>Server</u>	<u>Version Minimum</u>
Windows	64-bit versions of Windows Server 2008 and Windows Server 2012
Linux	Not available at this time
